4 Picos

Ultra high speed ICCD camera

200ps highest shutter speed
Best imaging quality
Single photon detection
Compact and light design
Based on more than 25 years of experience in the field of high speed intensified imaging, Stanford Computer Optics, is developing pioneering, ultra fast-gated intensified CCD (ICCD) cameras. The 4 Picos ICCD camera includes cutting-edge electronics and provides ultra high shutter speeds with sub-nanosecond gating time down to 200ps.

**High performance and reliable electronics**
The 4 Picos ICCD camera is equipped with high resolution image intensifier which provide highest temporal resolution available and excellent sensitivity down to single photons. With quality CCD sensors and high resolution image intensifier the 4 Picos ICCD cameras provide exceptional performance and superior image quality. Long-lasting and reliable electronics ensure trouble-free and undisturbed intensified imaging experience.

**Down to 200ps flat top, true optical gating time**
In-house developed, custom-built electronics provide extreme low jitter and low propagation delay. The flat top, true optical gating time of down to 200ps is still unique and unrivaled. The extreme low jitter of 10ps and highest accuracy in gate and delay time control of 10ps resolution provides unique capabilities for time resolved measurements.

**Unique ICCD camera with picosecond resolution**
The adjustable MCP voltage, multiple trigger options and various operation modes make the 4 Picos most flexible and versatile intensified CCD camera. Optionally, the 4 Picos ICCD camera can be equipped with up to 2MHz (on request 5MHz) continuous photocathode gating repetition rate and increased signal amplification using a V-stacked double multi-channel plate (MCP) image intensifier.

*Images cover & backside:*
A water droplet transformed into the plasma state by a focused Laser beam. The plasma development induce a fast expansion with strong dynamics. The images show the plasma development within the first 40ns after the Laser pulse. The images show a area of 1mm by 1mm and are taken with exposure time of 200ps.

Highlights

- Fastest optical gating down to 0.2ns
- Superior image quality by customized lens coupling
- High system sensitivity with single photon detection
- Long-lasting electronics (24 months warranty)
- Compact and light design

**Standard features and benefits**
- Shortest shutter time 200ps
- Gating time from 200ps .. DC
- Internal delay times: 0 .. 80s
- Highly accurate timing control with step size of 10ps
- Extreme low jitter: 10ps
- High resolution image intensifiers with optical system resolution of >60lp/mm
- Spectral sensitivity from UV to red (depends on type of image intensifier)
- Brilliant sensitivity providing single photon detection
- Adjustable MCP voltage for 50db dynamic range in signal amplification
- Multiple exposure operation with up to 3.3MHz (burst mode) and 200kHz (continuous) optical shutter repetition rate
- Customized f/0.8 distortion free lens coupling between image intensifier and CCD
- High dynamic range up to 14bit resolution
- Multiple trigger options: 3x input; 3x output
- USB 2.0 (standard) USB 3.0 (optional) output
- Remote interface for real time camera control
- Compact and light system design
- 4 Spec E software

**Optional features**
- Nikon F-Mount Adapter
- Two discrete images with double frame mode (fast interframing time 500ns) with P46 phosphor, only
- High photocathode gating repetition rate up to 2MHz continuous; on request up to 5MHz available
- Adapters for various spectrometer
- Vacuum flange for UHV connection
The 4 Picos ICCD camera features high resolution intensified imaging for sharpest images with 0.2ns true optical gating. The 4 Picos camera provides highest sensitivity with new Gen II high Quantum Efficiency photocathodes and provides the best intensified image quality through customized lens coupling without compromising vignetting, distortion and coupling efficiency. All CCD sensors are front-illuminated types and provide best image quality with low noise and high fill factor.

**Best performance CCD sensors**

**High resolution, high dynamic range imaging sensors**

The 4 Picos ICCD camera features high resolution intensified imaging for sharpest images with 0.2ns true optical gating. The 4 Picos camera provides highest sensitivity with new Gen II high Quantum Efficiency photocathodes and provides the best intensified image quality through customized lens coupling without compromising vignetting, distortion and coupling efficiency. All CCD sensors are front-illuminated types and provide best image quality with low noise and high fill factor.

The CCD sensor is automatically cleared before triggering at trigger frequencies below 4Hz. This ensures the best and most efficient reduction of CCD sensor background noise.

**High fill factor**

The interline CCD sensor provide highest fill factors using micro lens arrays on top of the active pixels.

Superior timing control with on-board delay generator

The on-board digital delay generator provides accurate timing control of the photocathode gating. All true flat top optical gating times are measured in single shot measurements. These measurements do not include the positive influence of signal jitter in integrating measurements.

4 Picos ICCD camera captures the motion of light

The ultra high speed shutter system of the 4 Picos ICCD camera provides shortest gating times down to 200ps flat top at single shot measurements. This feature is unique and enables trapping the motion of light.

Direct measurement of the gating time.
For the direct measurement of the gating time the 4 Picos ICCD camera is placed perpendicular to a ruler which is pointing in the propagation direction of a femtosecond laser. The width of a fs laser pulse is a fraction of a millimeter and it is moving with the speed of light. Thus the measured distance which the laser pulse travels while the shutter of the 4 Picos camera is open indicates directly the single shot gating time.

Direct measurement versus FWHM specifications
All ICCD cameras from Stanford Computer Optics are indicated with the minimum single shot gating time. In contrast to this direct measurement of the gating time most competing ICCD cameras are stated using FWHM (Full Width Half Maximum) specifications for the shortest gating time. The FWHM specification is determined by integrating a series of laser pulses. Due to the jitter of the camera and the light source the accumulated signal is similar to a Gaussian curve. Hence the specified FWHM gating times are faking shorter times and ignoring the long tails. However, especially these long tails are causing blurred and fuzzy images.

The image shows the distance a femtosecond laser pulse moved along a ruler while the shutter of the 4 Picos camera was open. This distance is a direct measure of the flat top, single shot gating time.
**Lens coupling system**

The lens coupled ICCD cameras provide superior image quality.

All 4 Picos ICCD cameras are equipped with the in-house developed, customized f/0.8 lens coupling system. It provides superior imaging quality without compromising distortion, resolution and vignetting. In contrast to other claims the lens coupled ICCD camera systems provides single photon detection and high S/N ratio at low light environment. The stray light is reduced using convenient anti-reflex coatings which results in magnificent optical contrast. Furthermore, in combination with the adjustable MCP voltage it proves high dynamic range, large linearity and ensures a great life span of the imaging system.

### Coupling image intensifier → CCD sensor comparison

<table>
<thead>
<tr>
<th>Parameter</th>
<th>F/0.8 lens coupled ICCD camera</th>
<th>Fiber-optic coupled ICCD camera</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO honeycomb pattern</td>
<td>CLEARLY visible honeycomb pattern</td>
<td></td>
</tr>
<tr>
<td>Advantages</td>
<td>+ excellent coupling efficiency by F/0.8 lens + superior image quality + highest modulation transfer function (cut off @ 180lp/mm) + NO honeycomb pattern + NO vignetting + NO distortion (&lt;0.03%) + cost efficient + variable setup (e.g. easy repair and replacement of each single component, especially image intensifier)</td>
<td>+ good coupling efficiency + compact design</td>
</tr>
<tr>
<td>Disadvantages</td>
<td>- stretched design</td>
<td>- poor image quality - lower modulation transfer function - distortion &gt; 3% - CLEARLY visible honeycomb pattern - cost intensive - fixed structure e.g. no repair or replacement</td>
</tr>
</tbody>
</table>

In summary the fiber-coupled ICCD camera systems provide lower image quality and less flexibility in combination and maintenance. Whereas the often claimed much better coupling efficiency diminish after taking into account the coupling loss, the core-cladding-ratio of the fibers and the significant loss of the fiber optic due to diameter reduction. On the other hand the customized F/0.8 lens coupling system provides best intensified image quality, high flexibility and excellent coupling efficiency.
4 Picos family

Customize the optimum 4 Picos ICCD camera for your application

The 4 Picos ICCD camera enables the customization to the requirement and needs of your experiment. This guarantees best performance in combination with superior intensified imaging. Please follow the indicated four step process to get the best and most suiting ICCD camera for your application.

1. Minimum gate time
If the preferred minimum gate time is 200ps the 4 Picos is the “camera of your choice”.

For min gate time in the nano-second regime please see our 4 Quik E ICCD camera.

2. Image intensifier

2.1. Photocathode
- UV high QE
- optional: blue high QE
- green high QE, red high QE
(see details on next page)
- input window: quartz or MgF2 on request

2.2. Multi-channel plate (MCP)
- single or
- dual stage (optional)

2.3. Phosphor screen
- P43 standard
- P46 optional
(requested for 500ns fast dual frame mode)

3. CCD sensor

3.1. Resolution of CCD sensor
- standard resolution: 780 x 580 pixel
- high resolution: 1360 x 1024 pixel

3.2. Dynamic range of CCD sensor
- 12bit or
- 14bit

3.3. Digital output
- standard: USB 2.0
- optional: USB 3.0 (2019)

4. Selection of optional accessories and adapters

<table>

<td>input objective lens</td>
<td>various input objective lenses e.g. Pentax UV lens 25mm, F2.8-16; Pentax UV lens 78mm, F3.8-16F3.8-1, others on request</td>
</tr>
</tbody>
</table>

Please contact our sales team to get assistance and further details to these options.

Customize the 4 Picos camera in 4 steps:
1. Select the minimum gating time
2. Select the optimum image intensifier
3. Choose the ideal CCD sensor
4. Pick the required accessories
High performance image intensifier

Guidance to make the right choices in order to get the most suitable image intensifier.

The image intensifier is a key component of each ICCD camera. This section deals with the fundamental characteristics of image intensifiers and their options. Different applications of ICCD cameras have different demands and requirements on the camera and thus on the image intensifier.

Following questions need to be addressed

- What are the spectral characteristics of the illumination?
  - Does determine the suitable photocathode.
- How fast need to be the shutter/shortest gating time?
  - Highest shutter speed does have some constrains to e.g. size of the image intensifier.
- How much light is there?
  - Dual stage MCP's have better performance at low light environments but less.
- High speed or low light imaging?
  - Does determine the suitable phosphor screen.

First the incoming photon releases an electron in the photocathode, second the electron is accelerated and amplified to an electron avalanche within the multi-channel plate (MCP), third the accelerated electrons are converted into photons by the phosphor screen.

New: Gen II High QE photo cathodes
The new Gen II high Quantum Efficiency photo cathodes are providing the best spectral responsibility performance.

</tbody>
</table>
Image intensifier specifications

**Shutter speed**
The shutter speed is limited by the speed of light since any electromagnetic signal does not travel faster.

**Input window**
The standard input window is made of quartz. This limits the UV spectral range below 165nm. The optional Magnesium Fluoride (MgF2) window enables measurements down to 110nm.

**Photocathode**
Photocathodes define the sensitivity and the spectral response of the image intensifier.

**Phosphor screen**
There are three important considerations in choosing a luminous (phosphor) output screen.

1. spectral emission range
2. efficiency
3. phosphor decay time

The P43 phosphor screen has a higher efficiency, however, a longer decay time. For fast applications e.g. double frame mode with interframing time of 500ns the P46 phosphor screen is necessary to avoid ghost images from the previous exposure.

**Multi-channel-plate (MCP)**
Image intensifiers can be equipped with single or double stage MCP’s. The single stage MCP features excellent signal gain and fits most applications of the ultra high speed ICCD cameras.

The V-stacked double MCP’s are especially used for extreme low light environments. The increased electron multiplication provide single photon detection with increased signal to noise ratio and reduced ion feedback noise. Therefore, the double MCP is mainly used for long exposure measurements and extreme low light applications.

Extended warranty on all products from Stanford Computer Optics

2 years on mechanics and electronics
Stanford Computer Optics Inc. warrants all new products to be free from defects in materials and workmanship for 24 months from the date of dispatch.

1 year on image intensifier
Image intensifiers are subject to the original manufacturer’s warranty conditions. It comprises a warranty of 12 months. In case of any defect the Paul Hoess KG or Stanford Computer Optics Inc. will assist for repair or replacement.

Warranty restriction
Warranties do not cover normal wear, misuse, negligence or accident. They do not apply to goods which have been misused, altered, inadequately maintained, stored incorrectly, or negligently installed or serviced.
Applications

4 Picos ICCD camera provides user-friendly intensified imaging for numerous, different applications

**Fluorescence lifetime imaging microscopy (FLIM)**
e.g. by S. Cheng from the Texas A&M University, United States: Optics Letters, Vol. 38, Issue 9, 2013
and Y. Sun from the University of California-Davis, United States: Optics Letters, Vol. 34, Issue 13, 2009

**Fluorescence resonance energy transfer (FRET)**
e.g. by A. L. Rusanov from the Russian Academy of Sciences, Russian Federation: J. Biophotonics, Vol. 3, Issue 12, 2010

**Fusion reaction diagnostic**

**Gated viewing 3D laser radar**
e.g. by J. F. Andersen from the Danisch Defense Reasearch Establishment, Denmark: Applied Optics, Vol. 45, Issue 24, 2006

**Photoluminescence**
e.g. by S. I. Hintschich from the University of Durham, United Kingdom: Journal of Chemical Physics, Vol. 119, Issue 22, 2003

**Light intensity measurements over 11 orders of magnitude**
e.g. by C. Rothe from the University of Durham, United Kingdom: Phys. Rev. Lett., Vol 96, Issue 16, 2006

**Plasma expansion dynamics**
e.g. by C. Janzen from the Fraunhofer-Institut für Lasertechnik (ILT), Germany: Spectrochimica Acta Part B: Atomic Spectroscopy, Vol 60, Issues 78, 2005

**Spray analysis**
e.g. by T. Streibl from the Universität der Bundeswehr, Germany: Proc. SPIE 4308, High-Speed Imaging and Sequence Analysis III, 45, 2001
